

## ABSTRACT OF DISCLOSURE

In the multilayer circuit board, cable patterns in a plurality of cable layers can be precisely formed, and the cable layer are formed with higher density, with higher reliability. The multilayer circuit board comprises: a plurality of cable layers, each of which includes electric conductive sections; a plurality of first insulating layers, each of which encloses the electric conductive sections in each cable layer and fills spaces between the electric conductive sections; and post vias electrically connecting the electric conductive sections in one cable layer to those in another cable layer. Height of the electric conductive sections in each cable layer are equal to that of the first insulating layer enclosing those electric conductive sections.
